Module 1 Cheat Sheet: Python Basics

Package/Method	Description	Code Example
Comments	Comments are lines of text that are ignored by the Python interpreter when executing the code<./td>	# This is a comment
Concatenation	Combines (concatenates) strings.	<pre>Syntax: concatenated_string = string1 + string2 Example: result = "Hello" + " John"</pre>
Data Types	- Integer - Float - Boolean - String	Example: x=7 # Integer Value y=12.4 # Float Value is_valid = True # Boolean Value is_valid = False # Boolean Value F_Name = "John" # String Value
Indexing	Accesses character at a specific index.	Example: my_string="Hello" char = my_string[0]
len()	Returns the length of a string.	Syntax: len(string_name) Example: my_string="Hello" length = len(my_string)
lower()	Converts string to lowercase.	Example: my_string="Hello" uppercase_text = my_string.lower()
print()	Prints the message or variable inside `()`.	Example: print("Hello, world") print(a+b)
Python Operators	 Addition (+): Adds two values together. Subtraction (-): Subtracts one value from another. Multiplication (*): Multiplies two values. Division (/): Divides one value by another, returns a float. Floor Division (//): Divides one value by another, returns the quotient as an integer. Modulo (%): Returns the remainder after division. 	<pre>Example: x = 9 y = 4 result_add= x + y # Addition result_sub= x - y # Subtraction result_mul= x * y # Multiplication result_div= x / y # Division result_fdiv= x // y # Floor Division result_mod= x % y # Modulo</pre>
replace()	Replaces substrings.	<pre>Example: my_string="Hello" new_text = my_string.replace("Hello", "Hi")</pre>
Slicing	Extracts a portion of the string.	Syntax: substring = string_name[start:end] Example: my_string="Hello" substring = my_string[0:5]
split()	Splits string into a list based on a delimiter.	<pre>Example: my_string="Hello" split_text = my_string.split(",")</pre>
strip()	Removes leading/trailing whitespace.	Example: my_string="Hello"

12/21/24, 12.511 W		about.blait	about biairk	
			trimmed = my_string.strip()	
	upper()	Converts string to uppercase.	Example: my_string="Hello" uppercase_text = my_string.upper()	
	Variable Assignment	Assigns a value to a variable.	Syntax: variable_name = value Example: name="John" # assigning John to variable name x = 5 # assigning 5 to variable x
